Inventory Management System
User Manual

1. Dashboard Overview

The Dashboard is the central hub of the inventory system. Here you can monitor overall inventory health, track the location of items across different branches and blocks, and receive instant alerts for low-stock items. Use the sidebar navigation on the left to access different modules.

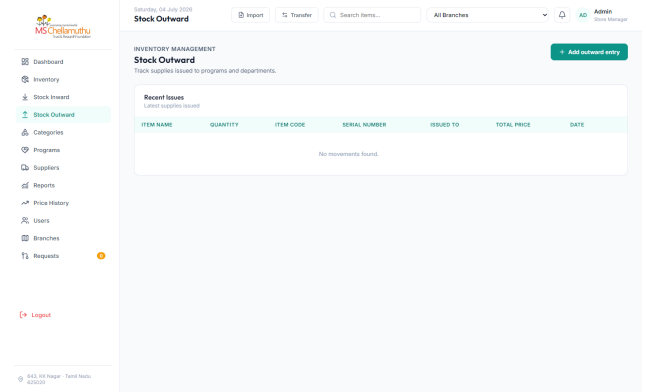

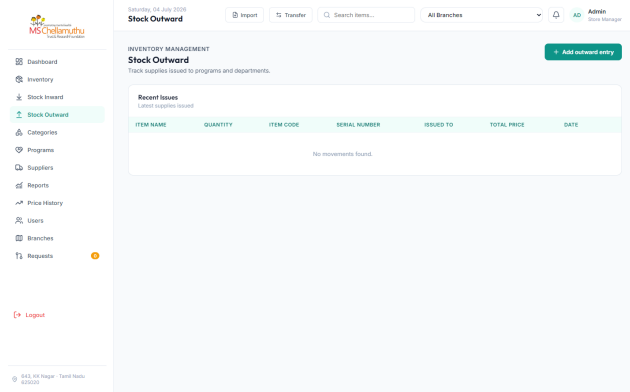

2. Stock Inward

When new stock arrives, use the Stock Inward process to record it. Navigate to the inward screen, select the item received, and enter the quantity. The system automatically fetches the Item Code and Serial Number, ensuring accurate and error-free data entry.

3. Stock Outward

To record items being consumed or distributed, use the Stock Outward modal. Select the item, specify the quantity, and optionally provide a reason for the outward movement. This keeps the current stock levels updated in real-time.

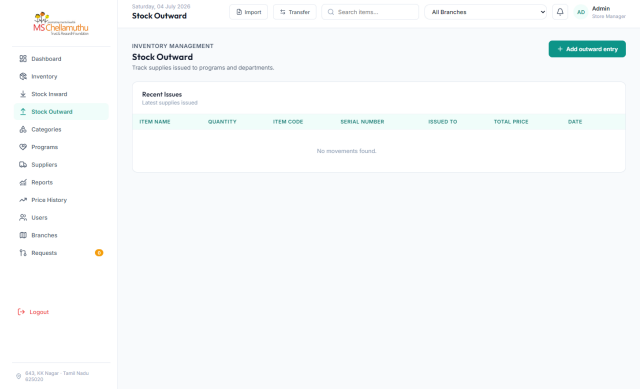

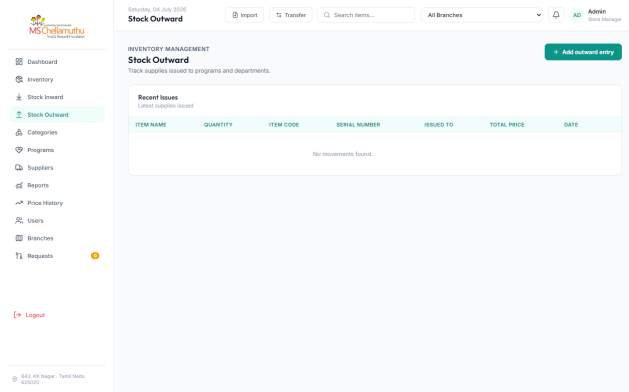

4. Transfer Stock

The Transfer Stock feature allows you to seamlessly move inventory between different blocks within your branch, or send it to another branch entirely. Note that transfers directed to a different branch will be queued for administrator approval before the stock is deducted.

5. Bulk Import

For large initial setups or mass updates, the Bulk Import feature saves time. You can download the provided Excel template, fill in your inventory details, and upload the file to instantly populate the database with hundreds of items.

6. Requests Panel

The Requests panel is an administrative control center. Here, administrators can review pending Branch-to-Branch stock transfers and item deletion requests. Admins can approve or reject these requests to maintain tight control over inventory movements.

7. Branches Management

The Branches management section allows administrators to configure the physical locations where stock is kept. You can add new branches and define specific blocks (such as rooms or wards) under each branch to track inventory precisely.
